CAFÉ SHOP PERFORMANCE

Business analysis report | Sales, demand patterns, product mix and store performance

1. Executive Summary

This report reviews café performance using the supplied Excel KPI and dashboard screenshots. The analysis focuses on sales value, transaction volume, hourly demand, product-category contribution, order-size mix and store-level performance. The dashboard reports total sales of $698,812.33 across 149,116 transactions/footfall records, with 214,470 items sold.

KPI	Reported result	Interpretation
Total sales	**$698,812.33**	Reported revenue measure
Transactions / footfall	**149,116**	Dashboard KPI; validate exact business definition
Quantity sold	**214,470**	Total item quantity
Average bill	**$4.69**	Sales ÷ 149,116, approximately
Average order	**1.44 items**	Quantity ÷ 149,116, approximately

Overall, coffee and tea are the leading category revenue drivers. Demand is concentrated in the morning, with the hourly quantity peak at 10:00. Friday has the highest daily order count in the supplied pivot, while Saturday is the lowest. These patterns create practical opportunities to align staffing, stock and promotions with observed demand.

2. Key Findings

2.1 Product-category sales mix

Coffee is the largest category at $269,952.45 (about 38.6% of reported sales), followed by Tea at $196,405.95 (about 28.1%). Together, these two categories contribute approximately 66.7% of total sales. Bakery contributes $82,315.64 (about 11.8%), and Drinking Chocolate contributes $72,416.00 (about 10.4%). Coffee beans contribute $40,085.25 (about 5.7%). Branded products, Loose Tea, Flavours and Packaged Chocolate make comparatively small contributions.

- Protect availability of coffee and tea: these categories represent roughly two-thirds of revenue.
- Review the commercial role of smaller categories: retain products that support basket-building, margin or customer choice, and reconsider low-performing SKUs using gross-margin and unit-sales data.

2.2 Hourly demand pattern

Quantity rises sharply from 6:00 to 8:00 and reaches its highest observed level at 10:00 (26,713 units in the hourly pivot). Volume then drops to 14,035 at 11:00 and remains comparatively steady through the afternoon before declining after 17:00. The 20:00 value is only 880, suggesting very low late-evening activity in the period represented by this dataset.

- Schedule adequate barista and counter coverage for the 8:00–10:00 peak, while using a leaner roster in quieter late hours where operationally feasible.
- Prepare high-volume coffee and tea inputs before the morning rush; use hourly sales and stockout records to fine-tune replenishment.

2.3 Day-of-week performance

Friday records the highest order count at 21,701, closely followed by Thursday at 21,654 and Monday at 21,643. Saturday is lowest at 20,510. The spread between the highest and lowest day is 1,191 orders (about 5.8% of Saturday's count), so weekday demand is relatively consistent rather than dominated by a single day.

- Use Friday and Thursday as priority days for staffing and inventory checks.
- Test a targeted Saturday offer or bundle, then evaluate incremental transactions and gross margin rather than sales alone.

2.4 Product-level sales leaders

The product pivot highlights Barista Espresso ($91,406.20), Brewed Chai Tea ($77,081.95), Hot Chocolate ($72,416.00), Gourmet Brewed Coffee ($70,034.60) and Brewed Black Tea ($47,932.00). These five products sum to $358,870.75, or approximately 51.4% of total reported sales. Product-level prioritisation should therefore focus on availability, recipe consistency and margin for these leaders.

2.5 Store-level comparison

The store pivot reports the following results. Hell's Kitchen has the highest transaction count (50,735), Astoria is close behind (50,599), and Lower Manhattan records 47,782. Sales are highest at Hell's Kitchen ($236,511.17), followed by Astoria ($232,243.91) and Lower Manhattan ($230,057.25). The differences are not large, so location decisions should be supported by store hours, footfall definitions, staffing costs, and gross margin before drawing conclusions about store productivity.

Store location	Sales	Transaction count
Hell's Kitchen	$236,511.17	50,735
Astoria	$232,243.91	50,599
Lower Manhattan	$230,057.25	47,782

2.6 Order-size distribution and data quality

The size distribution includes Large, Regular, Small and Not Defined. The dashboard indicates that Regular and Large orders each represent roughly 30% of the mix, Small orders about 9%, and Not Defined about 30%. The sizeable Not Defined segment is a data-quality opportunity: improving order-size capture would make customer and basket analysis more reliable.

3. Business Recommendations

1. Match staffing to demand — Build shift plans around the 8:00–10:00 peak and review whether staffing after 18:00 matches observed demand. Protect service speed during rush periods.

2. Protect top-category availability — Set par levels and reorder alerts for coffee and tea, then track stockouts, waste and gross margin by SKU.

3. Grow basket value carefully — Test coffee-plus-bakery or tea-plus-snack bundles. Compare average bill, items per transaction and gross margin against a baseline/control period.

4. Investigate store productivity — Compare sales per operating hour, transactions per labour hour, average bill and gross margin for each store before reallocating labour or marketing spend.

5. Improve data completeness — Reduce the Not Defined order-size segment, standardise product/category labels and verify that transaction IDs are unique at the intended grain.

6. Establish a recurring KPI review — Review weekly sales, transactions, average bill, items per order, category mix, hourly demand, stockouts and waste. Assign an owner and action for every material variance.

4. Suggested KPI Monitoring Framework

KPI	Why it matters	Recommended review
Net sales and gross margin	Measures revenue and profitability	Daily / weekly
Transactions and average bill	Separates traffic from spend per visit	Daily / weekly
Items per transaction	Tracks basket depth	Weekly
Sales by hour and weekday	Supports staffing and operating decisions	Weekly
Category/SKU sales and stockouts	Protects availability of key products	Weekly
Order-size data completeness	Improves segmentation reliability	Monthly

5. Data Checks and Interpretation Notes

- The KPI values and category/store values are transcribed from the supplied screenshots; the source workbook was not available for a row-level audit.
- The dashboard labels 149,116 as “Total Footfall,” while the KPI pivots also show 149,116 as the count of transaction_id. Confirm whether this represents unique transactions, customer visits or another measure before publishing externally.
- Average bill of $4.69 is consistent with total sales divided by 149,116. Average order of 1.44 is consistent with quantity divided by 149,116; confirm that this is intended to mean items per transaction.
- The visual labelled “Footfall over various Store Location” appears to use a currency-formatted axis, while the supporting pivot separates sales and transaction counts. Correct the chart title, axis format and series mapping so the visual communicates the intended measures.
- The product-level top-five total is $358,870.75, while the category-level sales total is $698,812.33. These are different cuts of the data; make sure the chart title clearly distinguishes top products from all-category revenue.
- No date range, cost data, margin data, staffing data or comparison period was visible. Therefore, this report describes observed patterns and proposes tests; it does not claim causal drivers or profitability conclusions.

6. Conclusion

The café dashboard points to a business with a strong core in coffee and tea, a pronounced morning demand peak, and broadly similar transaction volumes across the three locations. The most actionable next steps are to protect availability of leading categories, align staffing to hourly demand, test basket-building offers, and improve the completeness and clarity of reporting. Validating the footfall/transaction definition and correcting the store chart's axis/series mapping will strengthen confidence in the dashboard and make future operational decisions more defensible.
